

I've been working with Ken Norberg's K31 scope mount for the past few weeks. The more I shoot with it, the more I like it. And so far I like everything about it. I thought I would share some feedback on it to the board members.

Craftsmanship and design is superb. The mount is designed around industry standard "weaver" type ring attachments, which give a shooter a wide range of choices. The over bore design of the scope base gives the shooter the preferred scope mounting arrangement for sight picture and eye relief. This mount is indeed "Rock Solid" in it's very strong design and very strong 4 point drill and tap mounting to the receiver. Ken does this on a custom jig in his shop and it is done right.

One thing that I found ingenious about this mount is the shell ejection blade. When I first received my rifle back from Ken I had a few failures to eject of the empty cases. We talked about this on the phone. Ken told me, "the blade is designed to be tunable, just bend it up a little and try again". After bending it slightly upward, I have 100% ejection now. Very positive ejection I might add. And 100% clearance on the scope as well.

The mount's design does not detract from the beautiful lines of the rifle too. I really like that. I like the clamp-on type mounts for quick on/off utility, no alteration approach. But for a dedicated scope mount this is by far my choice. Sniper grade.
